Where is MAX-lab?

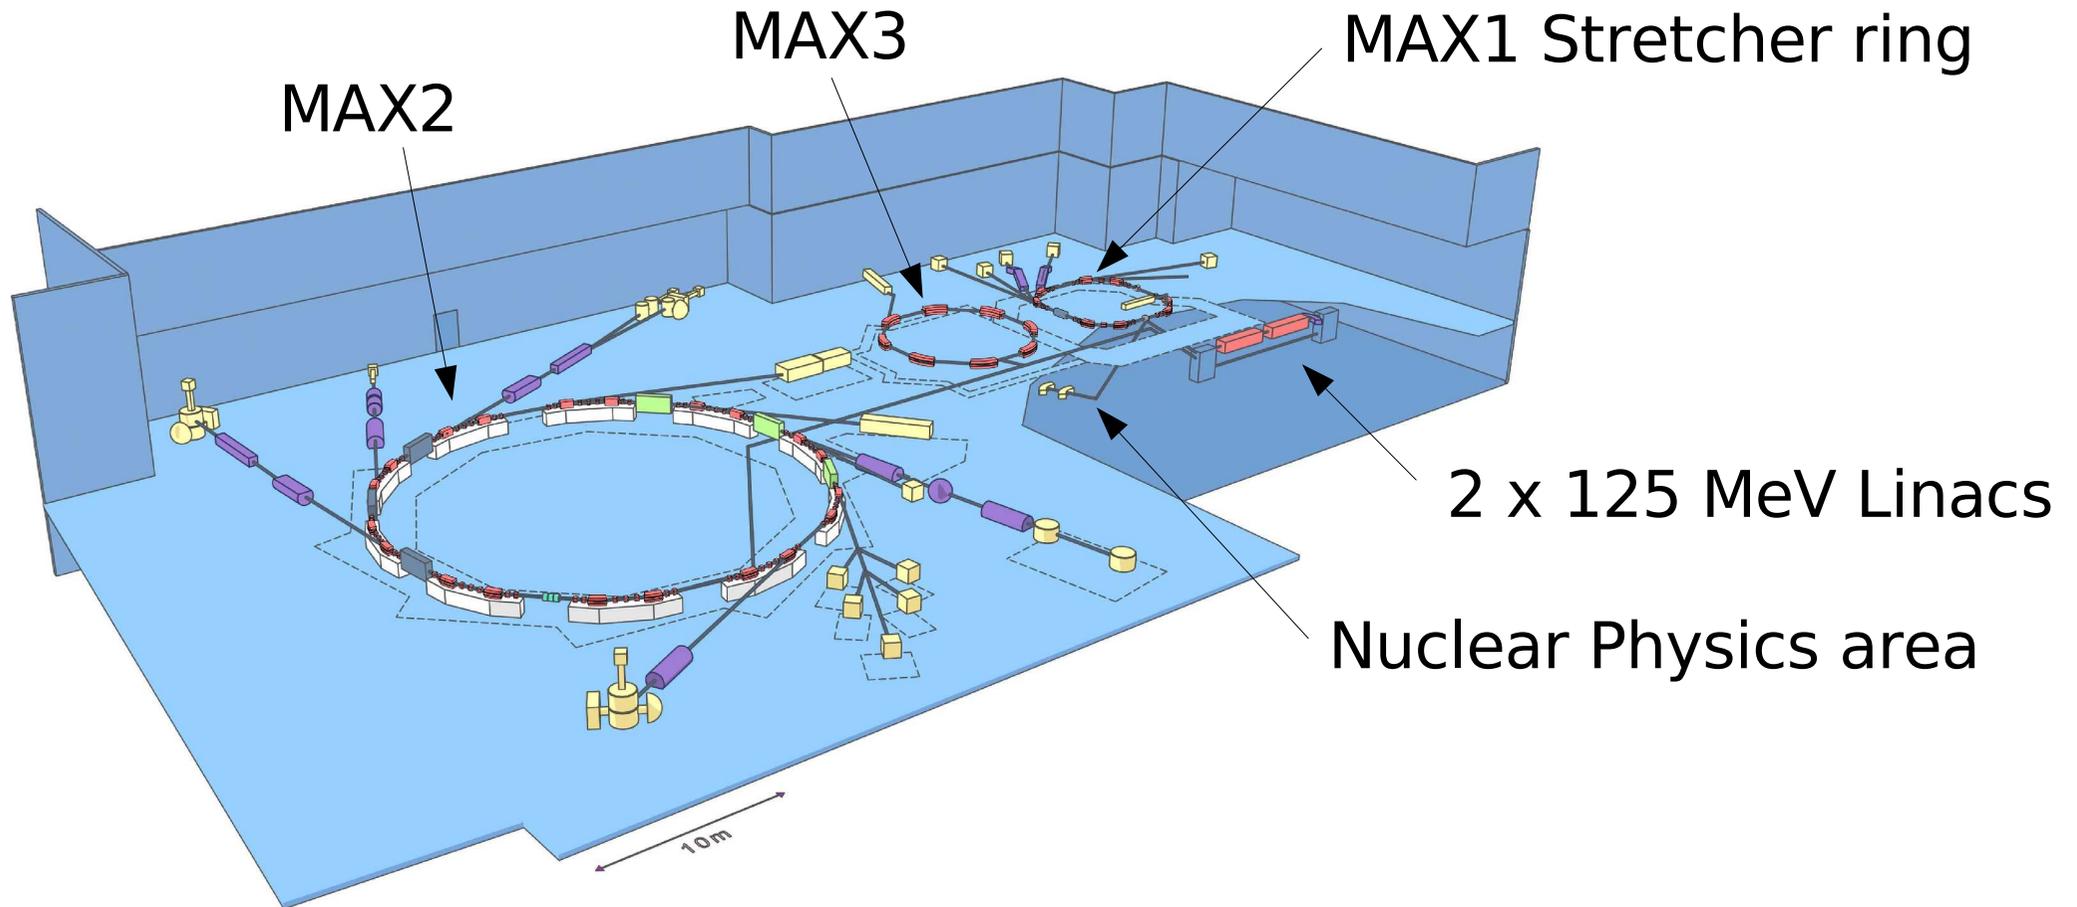

Lund, Sweden

Latitude: $55^{\circ} 42' N$

(Moscow: $55^{\circ} 45' N$)

MAX-lab accelerator system

Parallel operation of the three rings

Nuclear Physics: $\sim 45\%$ of beam-time at MAX1

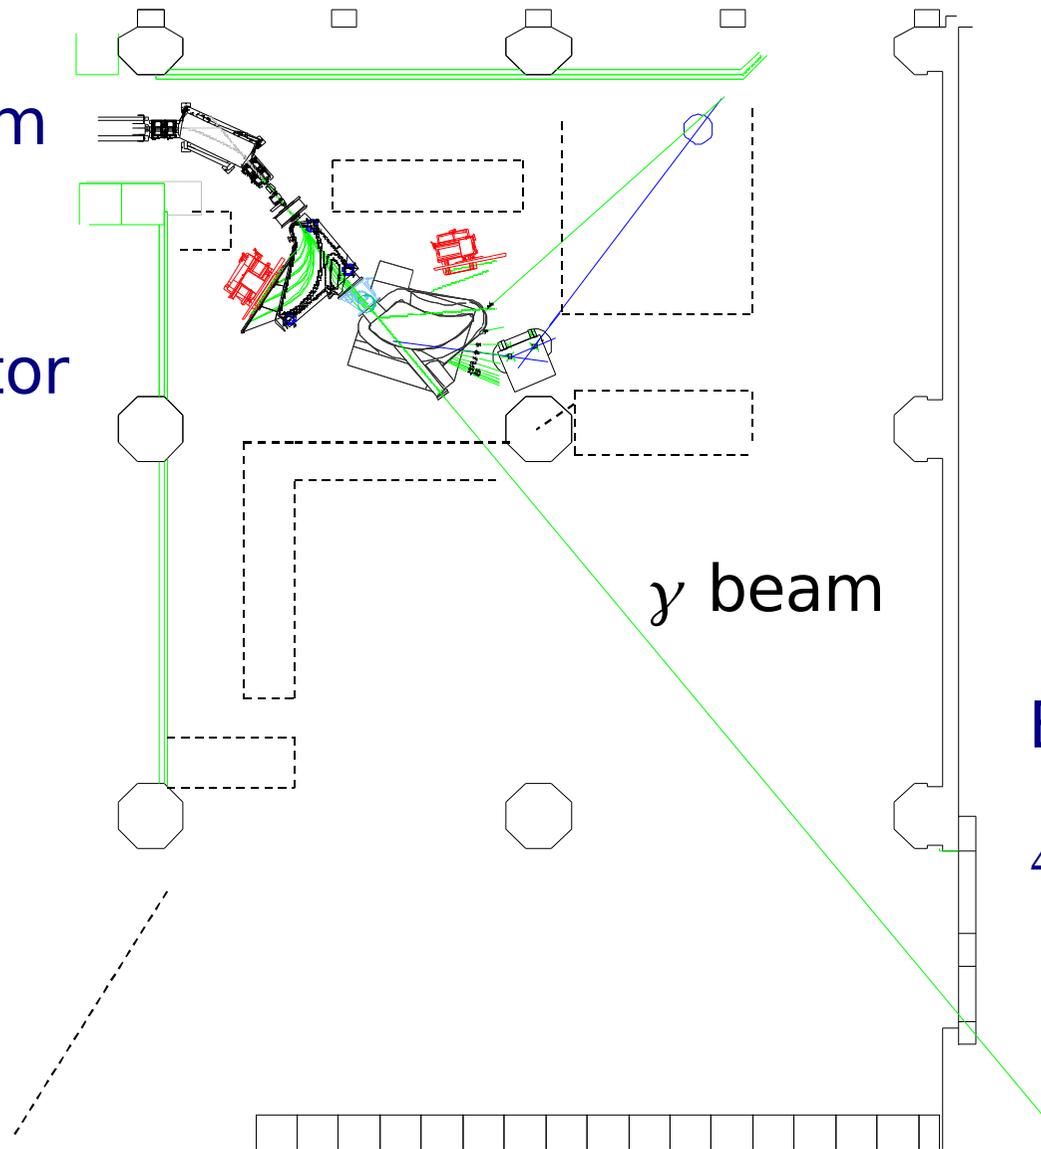

Upgraded beam in operation since September 2005

Tagged photon beam-line

Stretched e^- beam

~ 20 nA

$\sim 50\%$ duty factor

γ beam

$E_\gamma = 15-180$ MeV

$\Delta E_\gamma = 0.5-1$ MeV

10^6 MeV $^{-1}$ s $^{-1}$

Compton Scattering programme

- Deuterium

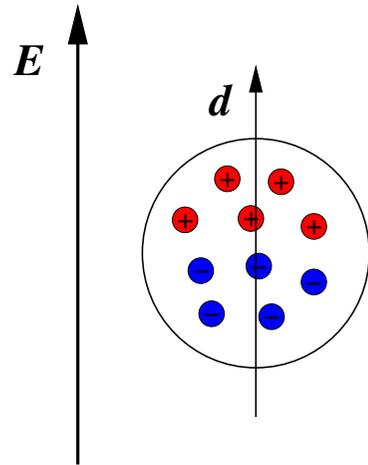

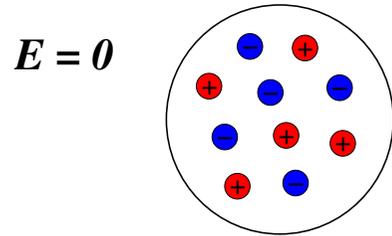

Extract neutron polarizabilities α_n and β_n

- ^4He , ^{12}C and ^{16}O

Extract polarizabilities of bound nucleons

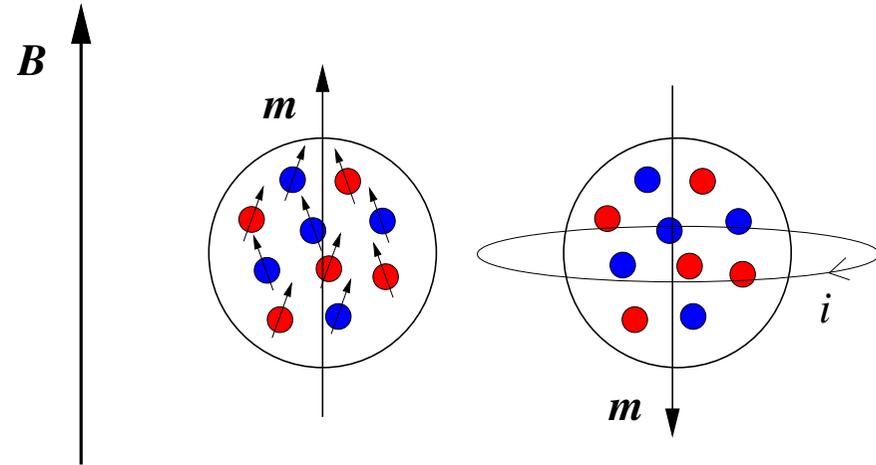

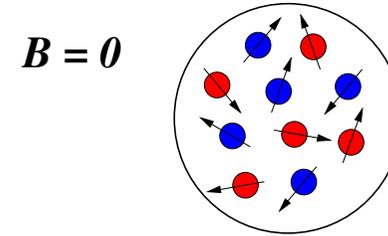

Polarizabilities

Electric (α)

$$d = \alpha E$$

Magnetic (β)

$$m = \beta B$$

α and β are intrinsic properties of the system

α_n and β_n from $D(\gamma,\gamma)$

α_p and β_p well known from $^1H(\gamma,\gamma)$ and

Baldin sum rule
$$\alpha_p + \beta_p = \frac{1}{2\pi^2} \int \frac{\sigma_{tot}(\omega)}{\omega^2} d\omega$$

$D(\gamma,\gamma)$:

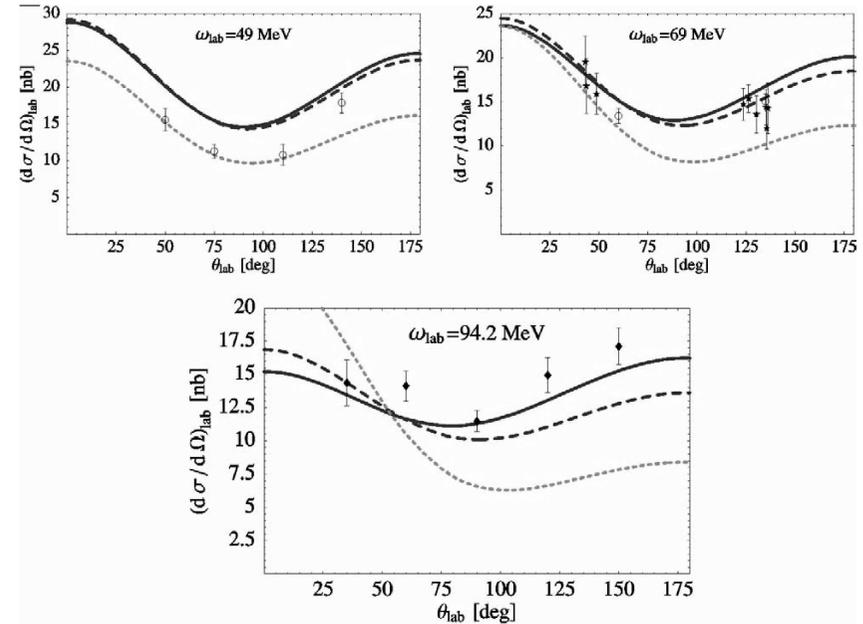

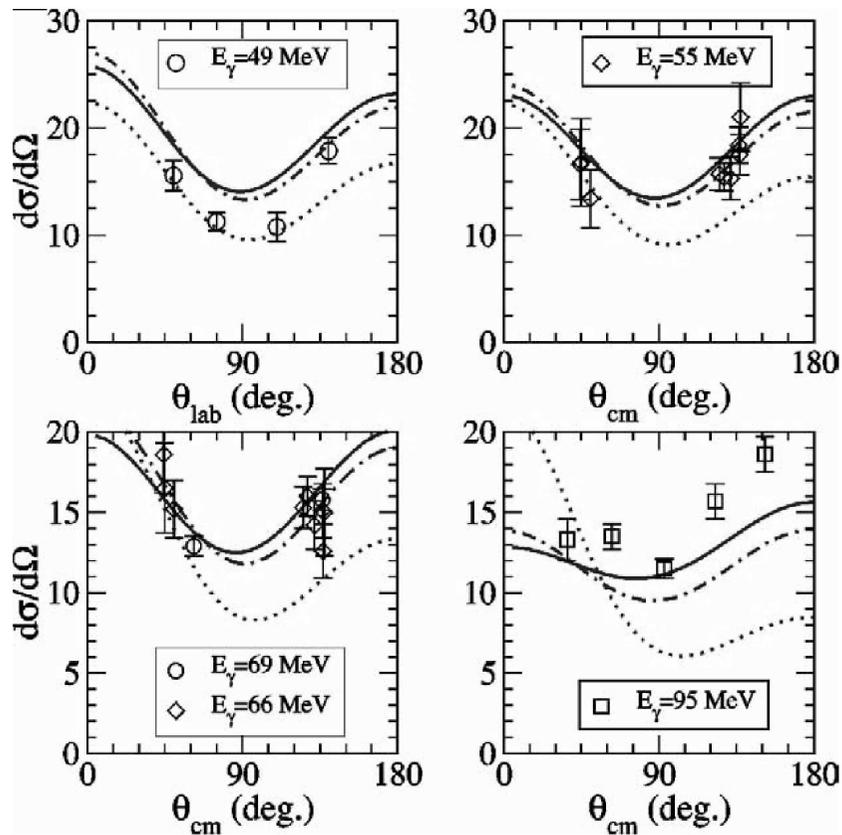

$\frac{d\sigma}{d\Omega}$ (backward direction) sensitive to α_N and β_N

\Rightarrow α_n and β_n can be extracted

Recent χ PT calculations

Beane *et al.*,
Nucl.Phys.A747(2005)311

Hildebrandt *et al.*,
Nucl.Phys.A748(2005)573

Δ -resonance
explicitly included

$$O(Q^4)$$

Need higher quality data

Goal of present $D(\gamma,\gamma)$ measurement

Significantly increase the world $D(\gamma,\gamma)$ data set:

- 40-110 MeV
- 30° - 150°
- Statistical errors $<5\%$

Set-up

Three of the largest
NaI-detectors worldwide:

CATS	(Mainz)
BUNI	(Boston)
DIANA	(Kentucky)

CATS

Standard electronics set-up

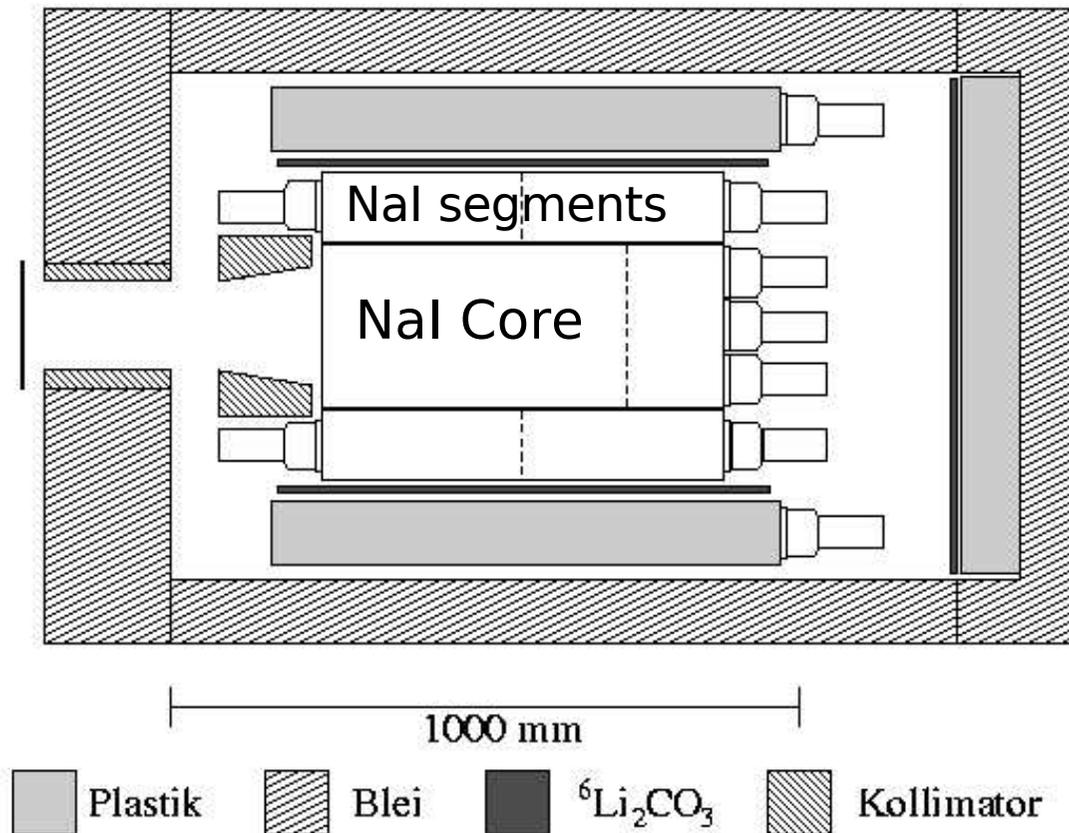

Trigger: single NaI-detector (scattered photon)

Incoming photon energy determined by tagger coincidences

Nal-detectors

The three detectors share a similar design:

CATS

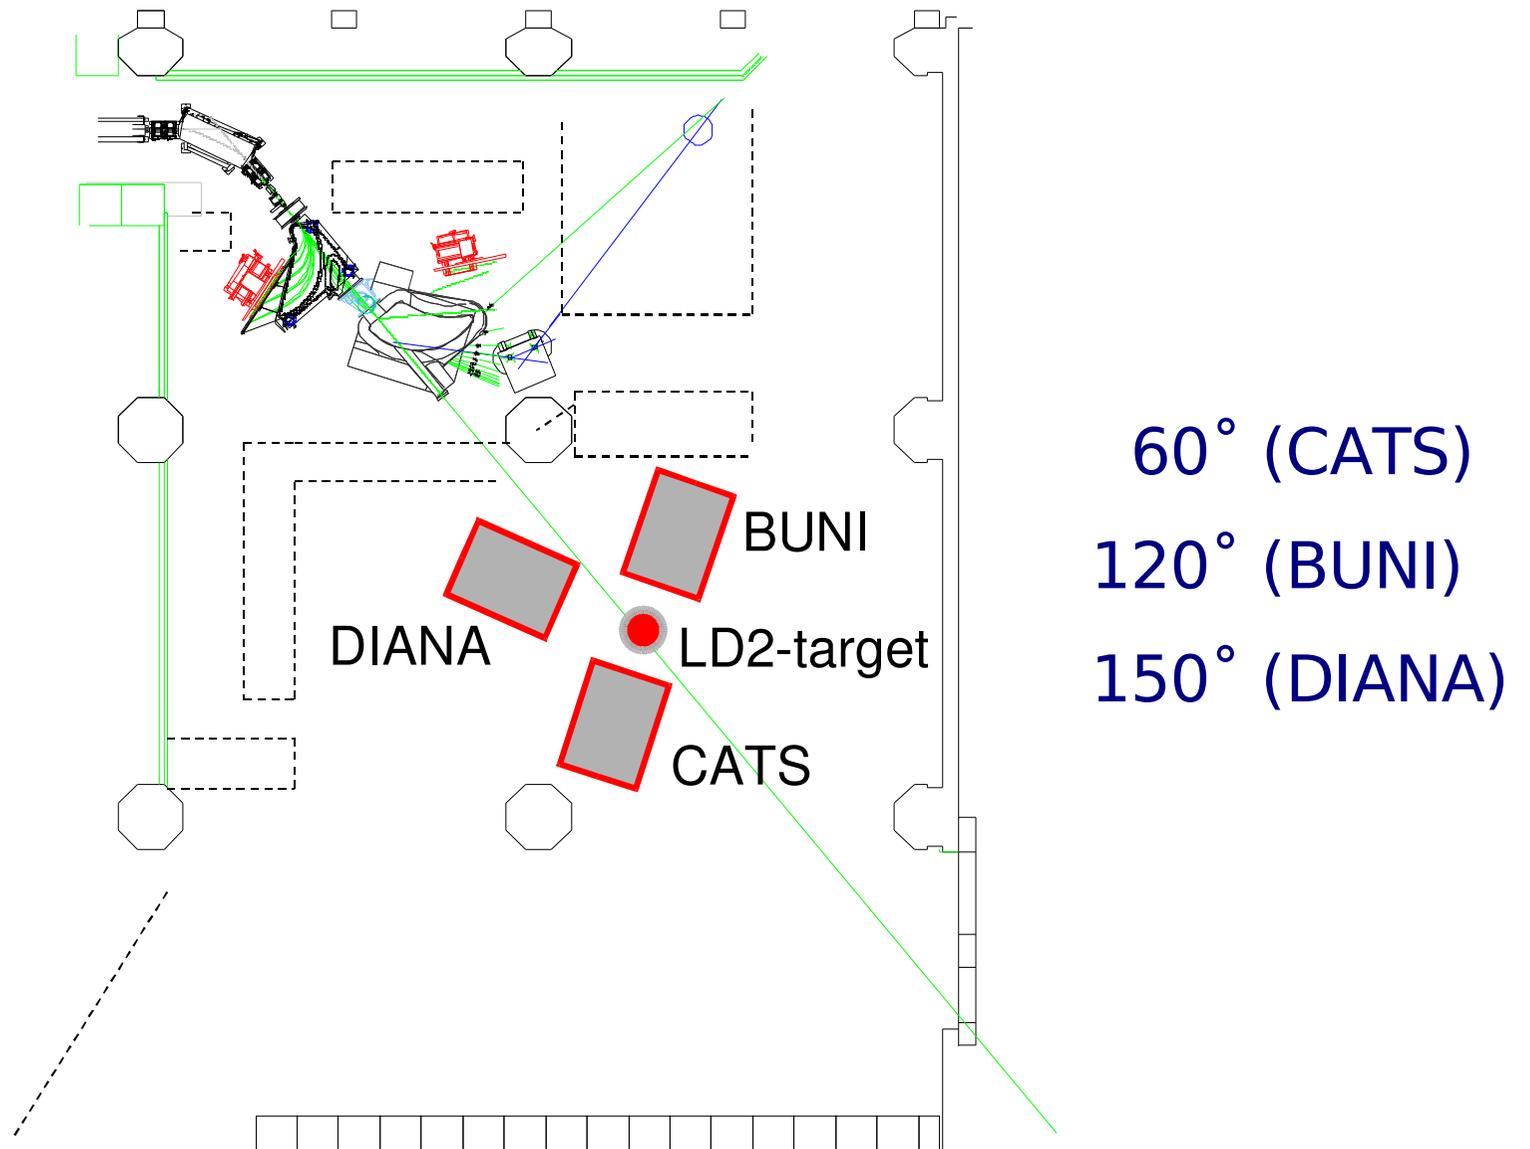

NaI Core: $\phi 27\text{cm} \times 64\text{cm}$

Six NaI segments

NaI total: $\phi 48\text{cm} \times 64\text{cm}$

(figure from O.Jahn, Diplomarbeit, Mainz)

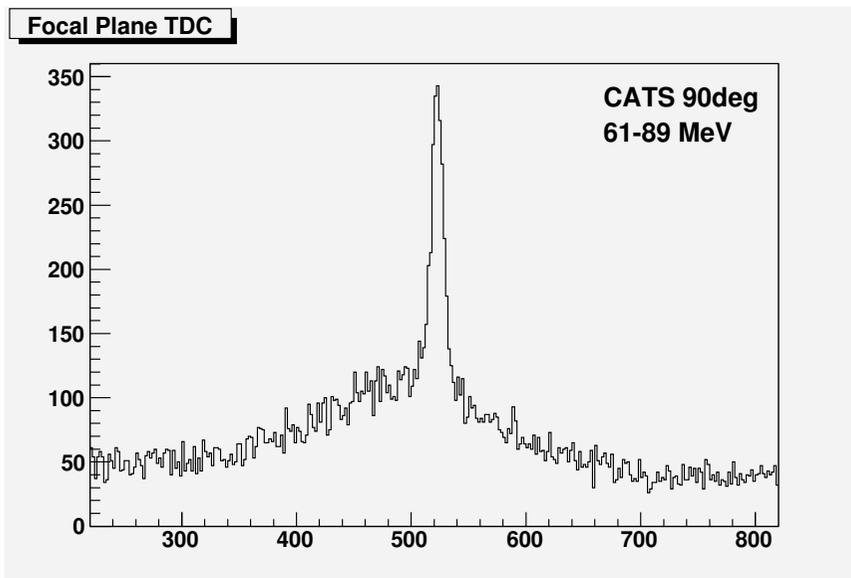

Detector configuration

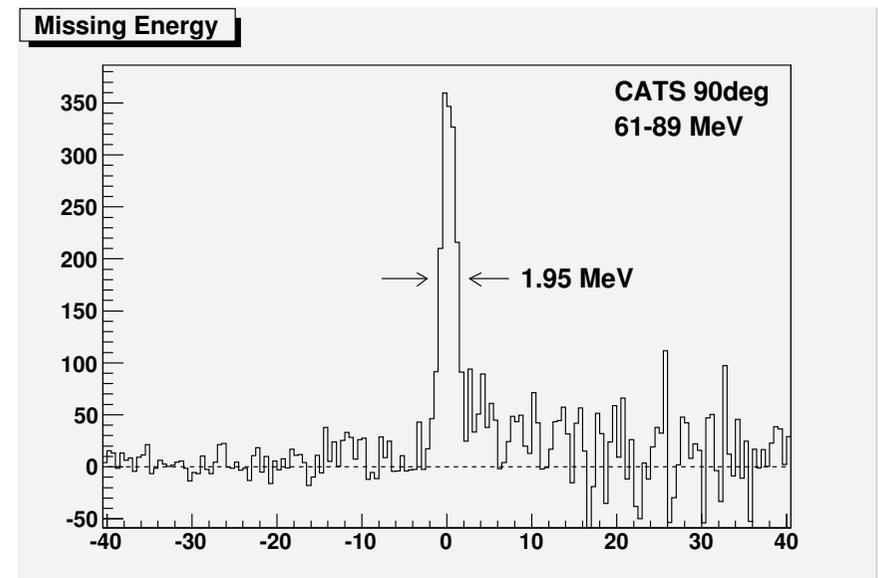

Carbon test measurement

Simpler target

20 times larger cross-section

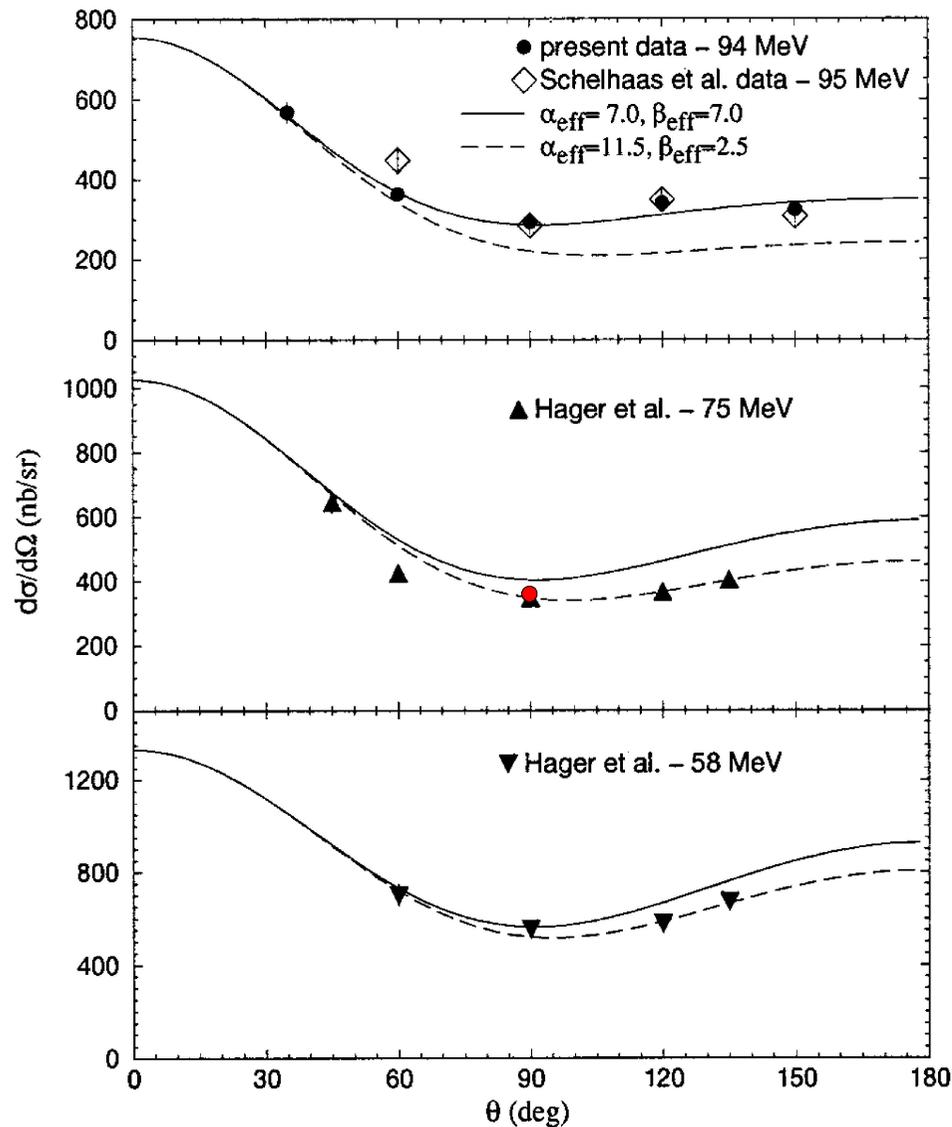

Tagger coincidences

Missing energy

Carbon cross-section

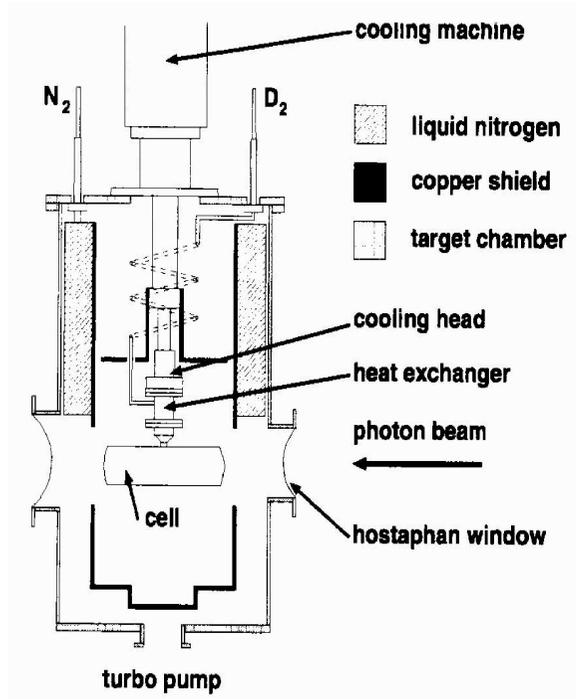

● Warkentin *et al.*, SAL

Summary

- Upgraded tagged photon beam at MAX-lab in routine operation
- Compton scattering experiments running on Deuterium, Carbon and Oxygen
- $^{12}\text{C}(\gamma,\gamma)$ cross-section agrees well with previous measurements
- $\text{D}(\gamma,\gamma)$ relative cross-sections show promise

Next step: 4 weeks of $\text{D}(\gamma,\gamma)$ in November 2009
